PENN METAL COMPANY

Metal Ceiling Department

BOSTON, MASS., U. S. A.

How to Order

Give character of work,—as Church, Hall, Store, etc., and send outline sketch showing all dimensions.

Note nature of surfaces, whether plaster, joist, sheathing, terra cotta, etc.

Select the patterns desired, giving unit numbers of field, border, cornice, etc., or give the combination number, if the entire design is wanted, as shown.

All prices made are f. o. b. Boston.

We are prepared to quote on stock or special designs, or on work installed complete, ready for final painting.

*Directions for Applying *Penco* Metal Ceilings*

Any carpenter or sheet metal worker can erect metal from our working drawings, or we can furnish mechanics at regular rates and expenses.

If surfaces are plaster or joist, use $\frac{7}{8}$ inch x $1\frac{1}{2}$ inch or 2 inch furring strips, placed as shown on working drawing, taking care to level the furring.

Place filler first, then cornice and field plates.

Stamped mitres are furnished at extra cost with certain cornices, but all cornices are easily mitred on the job, if desired.

To cut a mitre on cornice or mould, cut stock like a wood cornice of same section, only $\frac{1}{4}$ inch longer than needed, then snip this $\frac{1}{4}$ inch lap every $\frac{1}{4}$ inch, all the way up the lap, so as to bend same in or out, at right angles, to turn over the other member on an outside mitre, or to butt up against the other member on an inside mitre, then tamp down carefully.

All metal is primed one coat on each side before shipment, with light colored paint.

Count your stock upon arrival and see that it corresponds with the drawing, then follow the working drawing carefully.

This plan, with section shown above, illustrates the Penco single bead countersunk joint

It embodies all the advantages of our old double bead joint construction, at the same time simplifying the work of installation, and helps the appearance of the plate

This bead is made an inconspicuous feature of the ceiling

It provides a good nailing joint, conceals the point of contact from the eye and forms a dust proof joint

Notice how the bead ends line up with the outer edges of panelling, thus improving the appearance and allowing ample hammer room.

This cut shows the repressed beads and started nail holes, which will be furnished when called for, at a small additional charge.

*Penco Started Nail holes
Furnish a Perfect Solution of
Nailing Troubles*

Just a footing for the point of the nail

- a* — This guides the nail, thus saving time
- b* — Prevents slipping of point off the bead, ensuring perfect work

The nail being larger in diameter than the *started* hole, forces its own path against the resistance of the metal, obtaining, in this way, a clinch grip *on the metal*. This is not only vastly better than a mere head or rim hold, where the nail holes are punched full size, but the possibility of an extra small headed nail driving clear through the hole is hereby obviated.
